PROFESSIONAL SUMMARY

Final-year B.Tech student specializing in AI and ML, with hands-on experience in Docker, Kubernetes, Jenkins, ArgoCD, Terraform, and AWS. Built three production-grade DevOps projects that cut deployment time by **81%** and maintained **100% uptime** under peak workloads. Seeking a DevOps or Site Reliability Engineering role to contribute to CI/CD pipelines, cloud infrastructure, and DevSecOps practices.

EDUCATION

Rungta College of Engineering and Technology <i>Bachelor of Technology in Computer Science (Artificial Intelligence and Machine Learning)</i>	Bhilai, Chhattisgarh Sep 2023 – Sep 2027
---	--

EXPERIENCE

Web Developer Intern Datasoftisx - Identified UI inconsistencies across 3 product screens and rebuilt them as clean, reusable React.js components, cutting code duplication by 30% and improving Lighthouse performance scores by 15 points. - Developed 8+ responsive front-end modules, integrated 5 REST APIs, and optimized layouts for mobile, tablet, and desktop viewports, lowering API error rates by 20% and improving cross-device consistency.	Chennai, Tamil Nadu Jan 2025 – Feb 2025
--	---

PROJECTS

Retail Store Microservices App GitHub - A 5-microservice retail platform had no release pipeline, no GitOps workflow, and no consistent environment setup, making every deployment a manual and error-prone process. - Responsible for building a GitOps-driven CI/CD pipeline with zero manual steps across all AWS deployment environments. - Provisioned infrastructure using Terraform, deployed an Amazon EKS cluster, configured ArgoCD with NGINX Ingress and Cert Manager, and set up GitHub Actions to build and push images to Amazon ECR via Helm charts. - Delivered fully scripted deployment sync on every commit, eliminated all manual release steps, and enabled one-click rollbacks, dropping production deployment risk to near zero.	
FinFlow — Fintech CI/CD Pipeline GitHub - A fintech application processing 10,000+ daily transactions used manual deployments and had environment drift, causing 4-hour release cycles and 90-minute mean time to recovery. - Tasked with building a secure, observable CI/CD pipeline with security scanning on every commit to cut release time and shrink recovery windows. - Built a Jenkins multibranch pipeline with OWASP Dependency Check and Trivy security scans, deployed to Kubernetes via Helm and ArgoCD with AWS ALB, and set up Prometheus & Grafana for real-time monitoring. - Slashed release time by 81% (4 hours → 45 minutes), held 100% uptime at peak load, and decreased MTTR from 90 minutes to under 15 minutes.	
AWS ECS Node.js Deployment GitHub - A Node.js application ran on localhost with no containerization, cloud hosting, or monitoring, giving the team zero visibility into production behavior. - Responsible for containerizing the app, deploying it to AWS, and setting up centralized logging for reliable incident response. - Wrote a multi-stage Dockerfile to reduce image size, pushed to Amazon ECR, configured an ECS Fargate task with an Application Load Balancer and least-privilege security group rules, and enabled Amazon CloudWatch log streams. - Reached 100% service availability post-deployment, trimmed setup time to under 30 minutes, and built centralized logging that lowered mean incident resolution time by 60%.	

CERTIFICATIONS

Oracle Certified DevOps Professional	View	Oct 2025
Microsoft Azure Fundamentals — AZ-900.	View	Jun 2025
Microsoft Azure AI Fundamentals — AI-900	View	Jan 2026

TECHNICAL SKILLS

CI/CD Tools: Jenkins, GitHub Actions, ArgoCD
Containers & Orchestration: Docker, Kubernetes, Helm
Cloud Platforms: AWS EKS, ECS Fargate, ECR, EC2, VPC, S3, IAM, ALB
Monitoring & Observability: Amazon CloudWatch, Prometheus, Grafana
Security & DevSecOps: Trivy, OWASP Dependency Check, SonarQube
IaC & Scripting: Terraform, Ansible, Python, Bash, YAML
Version Control: Git, GitHub
